**Abstract**

This invention deals with an enhanced medical treatment system which seeks input from the patient and the physician about the medical problems faced by the patient. It analyzes this information and seeks to guide physicians to a correct diagnosis of the complaint. It also seeks to educate the patient about his/her medical problems and provides information about the problem. It is able to store all this information, so that a continuous record of the patient's visits and problems is kept on file and the physician is able to utilize the medical history to solve the patient's current problems. With this system in place the medical establishment will be able to improve health care delivery to the patients and be able to better manage the process of the providing health care. Furthermore, this system will also lower the cost of providing health care without compromising on the quality of health care.
